Earth Day 2015: These 10 Funds Prove Investors Can Beat The Stock Market By Going Green

Earth Day advocates will be very proud to boast that investors can beat the stock market while helping the planet. Going green is making big green in 2015. These ETFs easily eclipsed the S&P 500's 2.6% uptick, through April 20. Companies in these ETFs are projected to grow earnings at an average annual rate of 12% to 24% over the next five years compared with 10% for the S&P 500. Yet many of their valuations are still cheaper than S&P.

Renewables made up nearly all of the new electricity generation capacity in February, according to CleanTechnica.com. Given their rapid growth rate, it is possible they will account for all of the electricity produced in the U.S. in the near future.

Renewables currently account for 18% of U.S. power generation. Solar and wind together make up 7%. They have plenty of room to grow just to catch up with coal, at 28% of capacity, and natural gas, at 42% of total capacity.

ETF Name	Ticker	Total Assets in \$ Millions	% Expense Ratio	% Return YTD	Price/ Earnings Forward	Price/ Book	Price/ Sales	% Dividend Yield
